

Deadline timing and exam / robustness

26 of 41 eligible students have supplied grades

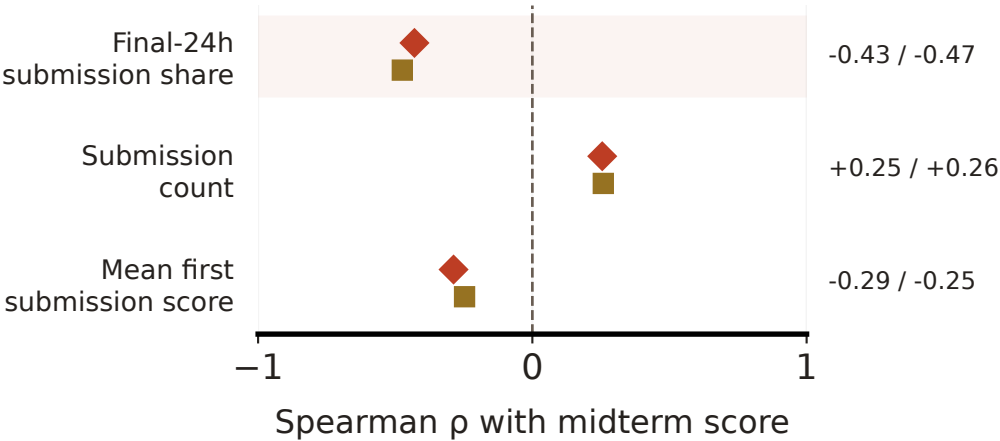

A Full cohort · dot = ρ , bar = 95% bootstrap interval

B Leave-one-out range · hollow dot = full estimate

C Subsets · diamond = all slots; square = omit discrepancies

A: 5,000 paired-student bootstrap draws; intervals reflect resampling variability.
B: 26 re-fits of $n=25$; the line is a range, not a confidence interval.
C: all 23 slots $n=23$; omit two discrepancies $n=24$. Exploratory, unadjusted associations.
